The sequence A is an octapeptide motif from the prion protein (PrP). The ligands are identified by binding assays with the peptide (A) or peptides containing (A). The ligands are used for detecting prion proteins (or prions) in biological or environmental samples, e.g. for diagnosis, also for removing them from samples, for treating or retarding development of prion-associated diseases, especially Creutzfeldt-Jakob diseases (in latrogenic, new variant, familial or sporadic forms), but also Gerstmann-Straussler-Scheinker disease, fatal familial insomnia, scrapie, bovine or feline spongiform encephalopathy, transmissible mink or exotic ungulate encephalopathy, or chronic wasting disease. The

                   AAM41991 standard; Protein;
                                                                                                                                                                                                                                                                                                 The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be us in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2001-465570/50.

                                                                                                                                                               in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathies and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune System suppression, Activinyinhibin activity, chemotactic/chemokinetic activity, hammostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tang

                                                                                                                         The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, Drager Syndrome system suppression, activinjoinhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        21-JAN-2000;

                                                                                                                                                                                                                                                                                                              polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, foremembers, come manning diagnostics, for mutations
                                                                                                                                                                       and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                  diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid in treatment of leukaemias. AAU29510-ABU33304 represent the amino acid

The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insectivoides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10176-ABL30511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins (ABB7377-ABB72072).

                                                                                                                                                                                                                                                                                            22- carbon fatty acids. Recombinant expression of C. elegans fat-1 polynucleotide in a wide variety of host cells, including Arabidopsis thaliana and Saccharomyces cerevisiae, produces a polypeptide with omega-3 desaturase activity. A host cell transformed with C. elegans fat-1 polynucleotide is useful for desaturating an omega-6 fatty acid to an omega-3 fatty acid by growing the host cell under conditions under which the polypeptide is expressed. The fat-1 polypeptide is useful for producing lipids having a higher proportion of omega-3 fatty acid and the lipids are useful as food, oils, as nutritional supplements, and as
                                                                                                                                                                                                                                                                                                                                                                                                                 acyl desaturase fat-1 polypeptide. The polypeptide desaturates omega-6 fatty acid to a corresponding omega-3 fatty acid by catalysing the introduction of an omega-3 double bond into 18-

FAT-1 polypeptide is useful for producing lipids ving a higher proportion of omega-3 fatty acid. Such lipids are useful food oils nutritional supplements and as chemical fedstocks.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence represents a human secreted protein encoded by a nucleic CC acid of the invention. Secreted proteins and their related nucleic acids CC can be used in the diagnosis of or susceptibility to a pathological CC condition by determining the presence or absence of a mutation in a CC nucleic acid or the presence or amount of expression of a secreted protein. The sequences are used to prevent, treat or amedical CC condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, CC chickens or sheep. The antibodies to the polypeptides can also be used in CC alleviating symptoms associated with disorders and in diagnostic CC immunoassays e.g. radioimmunoassays or enzyme linkedCC immunosorbent CC arthritis, hyperproliferative disorders e.g. neoplasms of the breast or CC liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. neoplasms of the breast or CC e.g. Alzheimer's disease, infections caused by bacteria, viruses and CC e.g. Alzheimer's disease, infections caused by bacteria, viruses and ccular disorders e.g. corneal infection. The peptides can also be used to aid wound healing and epithelial cell proliferation, to help crevent skin ageing due to sunburn, to maintain organs before CC additive or preservative to alter storage capabilities.

Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds t (I). A composition comprising (I) or a nucleic acid encoding (I), may used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromotography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment of the control of the con

       AAU03601-AAU03722 represent Group B Streptococcus (Streptococcus agalactiae) amino acid sequences of the invention. S. agalactiae is an encapsulated bacterium which is a major pathogen of humans causing sepsis and meningitis in neonates as well as adults. The S. agalactiae antigenic polypeptides are used to vaccinate against Group B Streptococcus infections, particularly to prevent infection in new born children
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB577737-ABB72072).
                                                                                                                                                New polypeptides derived from Streptococcus agalactiae are useful to provide detection of, and vaccination against, Group B Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                              Group B Streptococcus; encapsulated bacterium; therapeutic; sepsis

                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score

     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB

                                                                                                                                                                                               DOMAIN: THE RECEPTOR CONTAINS A CALCIUM CHANNEL IN ITS C-EXTREMITY. ITS LARGE N-TERMINAL CYTOPLASMIC REGION HAS THE BINDING SITE IN THE N-TERMINUS AND MODULATORY SITES IN THE PORTION IMMEDIATELY UPSTREAM OF THE CHANNEL REGION. PTM: PHOSPHORYLATED ON TYROSINE RESIDUES (BY SIMILARITY). MISCELLANEOUS: CALCIUM APPEARS TO INHIBIT LIGAND BINDING RECEPTOR, MOST PROBABLY BY INTERACTING WITH A DISTINCT CALCIUM-BINDING PROTEIN WHICH THEN INHIBITS THE RECEPTOR. SIMILARITY: BELONGS TO THE INSP3 RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                           ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN SHORT FORM/TIPR; ARE PRODUCED BY ALTERNATIVE SPLICING TISSUE SPECIFICITY: THE SHORT ISOFORM IS FOUND IN SKE
